Inter-country Comparisons of Government Arts Expenditure

The following Ask IFACCA question has been submitted to the IFACCA web site.

--------------------------------------------
From: Keith Kelly  
   Director, Public Affairs, Research and Communications  
   Canada Council for the Arts  
   Canada

Question
Quite often we are asked for international comparative data on government support for the arts on a total dollar or per capita basis. We have had difficulties ensuring that data are comparable - ie that we are comparing 'apples with apples'. Has someone cracked this nut and can they share the data with us?
--------------------------------------------

IFACCA’s Instant Response
This is an issue that arises regularly. The short answer to the query is 'no': no-one has yet 'cracked' the problems inherent in trying to make inter-country comparisons of government support for the arts.

Detail and discussion
A number of high-quality research reports on this issue have been released recently:

- National Endowment for the Arts (2000)
- Arts Council of Ireland (2000)

These reports are very similar in nature, in some places utilising the same data. The Arts Council of Ireland (2000) report is a good place to start investigating this issue, as it is the most recent and contains an excellent summary and analysis of the issues.

The reports contain tables comparing government expenditure in various countries, although all express warnings about the ability to draw meaningful conclusions from the data presented. Some of the caveats are serious indeed, and make it probable that differences in data are due more to differences in measurement than to underlying differences in government support for the arts. For example, different countries have different definitions of arts or culture and different mixes of policy instruments and tools.

The most obvious problem is in accounting for indirect forms of government support to the arts. In the Arts Council of Ireland analysis, taxes foregone were unable to be valued for any country other than Ireland, so estimates for this policy instrument were left out of the data. Few comparisons of government arts expenditures are able to account for these types of indirect forms of arts support, mainly because the data are simply unavailable: 'governments have still so few data relating to the precise cost of various tax concessions to the arts' (O'Hagan 2003; 453).

The inability to account for indirect expenditures leads to serious flaws in comparisons of government support for the arts, as indirect expenditures are at least as large as –
and in many cases are considerably larger than - direct expenditures. Arts Council of Ireland (2000; 10) estimates that including tax foregone would increase by 50 percent the measure of Irish government per capita arts expenditure (from 12.36 to 19.22 Irish Pounds). Schuster (2004) suggests that estimates from the USA indicate that direct government expenditure on the arts is 'dwarfed' by indirect government expenditure. O'Hagan (2003; 455) finds that the Value Added Tax (VAT) concession for the arts in Europe is not just the major tax concession in Europe, but that it alone is 'large...both in absolute terms and in relation to direct funding to [arts] insitutions.'

Overlaying these measurement issues is also the need to adopt an appropriate exchange rate to express figures in a common currency. A simple market exchange rate may fail to account for fundamental differences in real costs between countries.

The IFACCA secretariat warns that measurement issues such as these mean that comparisons cannot yet be made with any degree of confidence (a similar result was found for arts participation statistics in D'Art report number 2: www.ifacca.org/files/participationv2.pdf).

Some of the problems identified above can be overcome by looking at trend data, as long as institutional and policy changes can be accounted for (Australia Council, 2004). Both Arts Council of Ireland (2000) and National Endowment for the Arts (2000) report trend data, and reveal interesting trends in arts support, such as differences between countries in the ratio of national to local government support for the arts over time.

The future
The need and desire for developing more rigorous and internationally standardised cultural statistics has been expressed in a variety of forums. UNESCO has undertaken work on this since the '80s, when it developed its framework for cultural statistics. More recently, UNESCO has been focusing on the development of 'cultural indicators' (UNESCO 1986; 1998; and 2000), and recently co-hosted the International Symposium on Culture Statistics (www.colloque2002symposium.gouv.qc.ca/h4v_page_accueil_an.htm).

In Europe, a Eurostat Leadership Group has been working toward standardising European cultural statistics. A description of the group's work can be found in Arts Council Ireland (2000; 2).
